

Connecting cable for PC and power supply, M12 to USB

CP24H

Introduction

Instrument connection is easier when the same cable can link the device to a PC or power supply. CP24H provides this connection with an M12 connector on the instrument side and a male A-type USB connector on the PC or power supply side.

As an HID type cable, it supports straightforward PC use because USB driver installation is not required. This helps reduce setup effort when connecting compatible instruments for PC-based operation or power supply connection.
