

Serial connection cable for data logger PC connection

CP25

Introduction

Direct data logger connection saves setup time when configuration or data access has to be handled at the PC. The cable connects the instrument side through an 8-pole M12 female connector and links directly to the PC USB port.

A built-in USB/RS232 converter keeps the connection compact and avoids the need for a separate interface converter. With USB on the PC side and M12 on the instrument side, CP25 provides a clear, dedicated link between the data logger and the computer.
