

Static port accessory with bracket and silicone tube

FIXB001

Introduction

Barosense series installations need a clean static pressure pickup arrangement that is simple to specify during setup or service. FIXB001 combines the static port, support bracket and silicone tube in one accessory assembly.

The support bracket provides the named mounting element for the static port, while the silicone tube forms the connection component included with the accessory. This gives technicians a clear part for Barosense series configurations where these components are required together.

For maintenance, replacement or new installation work, FIXB001 keeps selection straightforward: one product reference covers the static port, bracket and silicone tube for the Barosense series.
