

Base with levelling device for LP...01 probes

LPBL

Introduction

Light probe positioning is easier when the probe base includes a levelling device. This accessory is intended for LP...01 probes, supporting measurement setups where the probe needs a defined base and aligned placement.

The integrated levelling device helps technicians set the probe position during installation or measurement preparation. This keeps accessory selection focused where LP...01 probe compatibility is required.

For replacement or configuration work, the item is clearly defined by its function: a base with levelling device for LP...01 probes.
