

Probe protection for Ø14 mm probes, 10µm steel

P6

Introduction

Compact Ø14 mm probe installations need protection that fits the smaller thread and still supports demanding temperatures. P6 provides a defined protective element for compatible probes with M12x1 thread.

The accessory uses 10µm sintered stainless steel protection. This gives the probe front a specified protective element while supporting selection for applications where stainless steel material is required by the setup.

With an operating temperature of -40...180 °C, P6 covers the widest temperature span shown for the Ø14 mm protection group, helping service teams identify the right part for high-temperature probe configurations.
