

Probe protection for Ø14 mm probes, 20µm PTFE

P7

Introduction

Smaller probe installations need protection that matches the thread and material specification without uncertainty during selection. P7 is designed for Ø14 mm probes with M12x1 thread, giving technicians a clearly defined accessory for compatible setups.

The accessory uses 20µm PTFE protection for the probe front. Its -40...150 °C operating temperature supports use across cold and high-temperature measurement environments where this protection type is specified.

For replacement, service or system configuration, P7 is identified by its Ø14 mm probe suitability, M12x1 thread and 20µm PTFE construction.
