

Probe protection for Ø14 mm probes, PBT and 10µm steel grid

P8

Introduction

Compact probe installations need protection that fits the probe diameter, thread and material requirement from the start. P8 is specified for Ø14 mm probes with M12x1 thread, giving technicians a clearly defined accessory for compatible measuring points.

The construction combines PBT with 10µm stainless steel grid protection. This gives the probe front a specified protective element while keeping selection straightforward during service, replacement or system configuration.

With an operating temperature of -40...120 °C, P8 supports use across cold and warm probe environments where Ø14 mm compatibility, M12x1 connection and stainless steel grid protection are required.
